

Longcliffe

Agricultural Lime products

- Lime for Land efficiency and in Cowsheds
- Limestone for Roadways
- Clean stone for drainage, concreting, Aggregates and Quarry Chatter for new building bases...

...all from a single source.

A proven 'growing' success and the expertise to increase your profits through increased land efficiency.

We make it... test for its use... we deliver it...

Field Testing Service

Years of experience has proved that good quality lime, correctly applied, is essential to help get the most from your land. Continued application of fertilisers and chemicals, it is recognised, calls for a periodic check to assess what might be the changing pH values of soils which is why Longcliffe has a testing service for your use, to test and report on each field, and to advise you on the most cost efficient corrective action for specific crops to be planted.

Quality Control

Longcliffe lime is produced and subjected to stringent Quality Control procedures to a specification of 55% nv as CaO and 40% passing 100BS sieve or 150 microns. To maintain its purity and consistency, Chemical analysis using an X-ray fluorescent analyser is performed in manufacture.

This technique allows rapid analysis of up to 10 elements with high accuracy, ensuring that quality standards are maintained with high production efficiency.

Particle size analysis is performed by either conventional test sieves or by advanced Laser diffraction.

Direct Delivery

Longcliffe has developed long and trusted relationships with the farming community. This experience in supplying the needs of farmers, combined with our own technical and scientific expertise, together with strict quality control in manufacture, ensures total reliability in the performance of our products. This assurance also extends to the reliable supply and Longcliffe delivers direct using our own fleet of transporters together with those of local contractors where appropriate to provide a truly farm-dedicated service to our customers.

Flotation, Tractor and Unimog Spreading

As well as soil testing for liming, Longcliffe can advise on the best means of spreading according to ground conditions and crops. A purpose built flotation spreader is designed to give flyweight performance even with a full 6 tonne load allowing the liming of seed beds and growing crops. Alternatively we can use a traditional tractor with spreader, and for greater speed, a four wheel drive Unimog. If conditions change and spreading is inadvisable we will deliver and then spread when conditions become right.

...and we can also spread it for you.

Limestone for Roadways, building and drainage

Limestone in various forms is an ideal material for driveways and cattle ways which often become rutted, preventing use during wet weather.

Limestone roadstone overcomes this providing a reliable, cost effective all-weather surface.

The Value of Lime in the Cowshed

In the cowshed Lime is important as a mild disinfectant which is known to help fight mastitis. It is a very economical drying agent when its cost is compared with other bedding materials.

It provides a non-slip surface and can be used in all types of cattle housing surface. We also supply clean stone for drainage, concreting, aggregates and quarry chatter useful for the bases of new buildings.

Calcium in Animal Feeds

Longcliffe is the UK's largest supplier of Calcium Carbonate (Limestone) to the Animal Feedstuff Industry.

The quality of the limestone deposit in the Longcliffe quarry is unsurpassed in this country and the wide range of products

derived from it in granular and powdered forms are used as a direct source of calcium and also as an inert carrier for vitamins and nutrients in many other product forms.
